

Water Discovery Tubes

Product Code: EY10019

- This is a great resource for experimenting and exploring. The children can select how they want to configure ie. position the tubes. By adding water to the cylinders they will then see jets of water burst out from the sides. The tubes can be placed on the ground but by placing them on a tray the water can be scooped up and used again.
- Provide a variety of receptacles to hold the water and to collect it. Consider how the children pour the water. What fine motor skills will they be using? Have jugs, watering cans, buckets, cups etc. Try to provide a variety of textures and materials. Enable the children to experiment with different containers that enable them to collect the water. Consider the accessories carefully and reflect how the children's learning will be enriched and developed.
